

1. Just used StackOverflow strictly to find out about the Arrays class methods used.
2. Only added bonus stuff and used the Arrays class
3. Project is complete
4. The main part of the project was really easy, the more difficult parts were the bonuses, as well as simply dealing with the unique integers. The logic for it was just tedious. Same with the sorting, I feel like I could have been more efficient with the sorting, but did the best I could.
5. I relearned how poorly designed the arrays are in java. ArrayLists are so much easier to use. I also relearned how to do selection sort.
6. I'll be honest, I'm not a fan of pseudocode, so I hope this step isn't asking for me to make even more pseudocode for the bonuses. If it's just looking for comments, then, it's already done.
